| 2. Task 2 ..... | 1 |

### 1. Task 1

The task is to not use reverse() or split (using [::-1]) and print an arr backwards. For this we use the "for" function and loop the original arr backwards and add the value to the new arr.

```
num_list = [3, 6, 9, 12]
def home_made_reverse(nlist):
    newlist = []
    for i in range(len(nlist) -1, -1, -1):
        newlist.append(nlist[i])
    return newlist

modded_num_list = home_made_reverse(num_list)
print(modded_num_list)
```

[12, 9, 6, 3]

### 2. Task 2

The task is to implement a sorting algorithm, which i implemented bubble sort.

```
def bubble_sort(arr, reverse=False):
    n = len(arr)
    # Traverse through all array elements
    for i in range(n):
        # Last i elements are already sorted, no need to check them
        for j in range(0, n-i-1):
            if (arr[j] > arr[j+1]) != reverse:
                arr[j], arr[j+1] = arr[j+1], arr[j]

arr1 = [64, 34, 25, 12, 22, 11, 90]
bubble_sort(arr1)
print("Sorted array (ascending):", arr1)

arr2 = [64, 34, 25, 12, 22, 11, 90]
bubble_sort(arr2, reverse=True)
print("Sorted array (descending):", arr2)
```

Sorted array (ascending): [11, 12, 22, 25, 34, 64, 90]

Sorted array (descending): [90, 64, 34, 25, 22, 12, 11]
